# What we know from these experiments

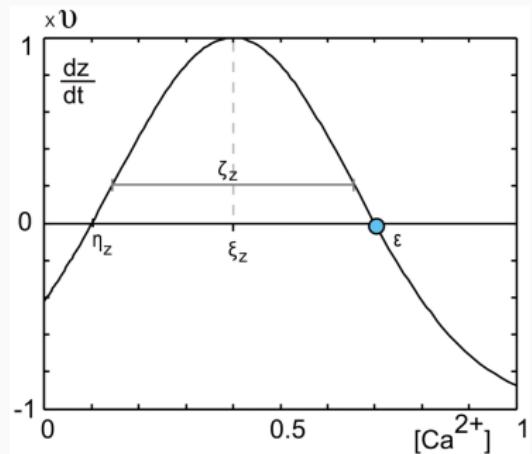

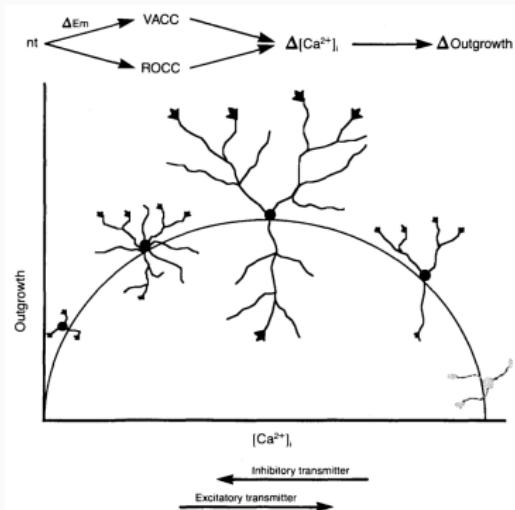

## What we know from these experiments

- Massive disinhibition in the LPZ.
- Gradual ingrowth of excitatory synapses from the peri-LPZ to the LPZ.
- Gradual outgrowth of inhibitory synapses from the LPZ to the peri-LPZ.

# Computational modelling: MSP: turnover

- Synaptic structures ( $z$ ): excitatory and inhibitory post-synaptic, excitatory or inhibitory pre-synaptic elements.
- New synapses form when free plugs are available: ( $z > z_{\text{conn}}$ )
- Synapses are deleted if: ( $z < z_{\text{conn}}$ )

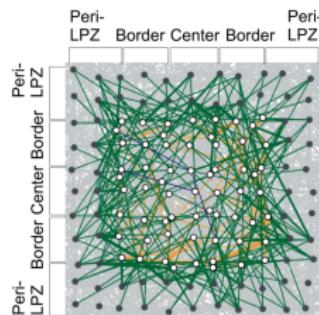

## Computational modelling II: Butz2013 replication

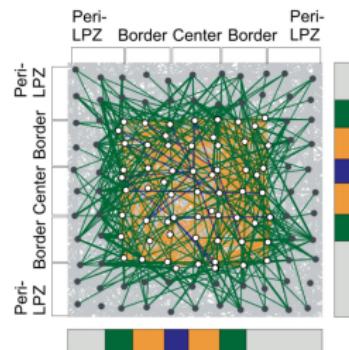

## Early phase

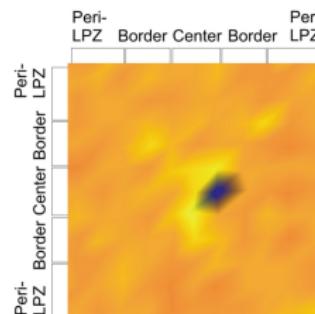

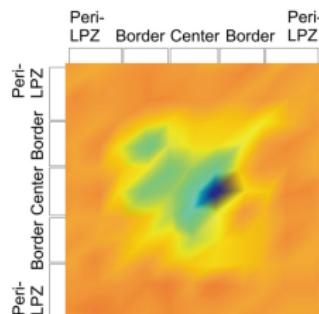

## Middle phase

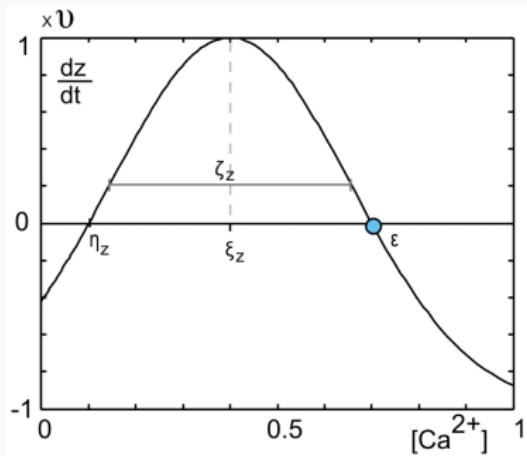

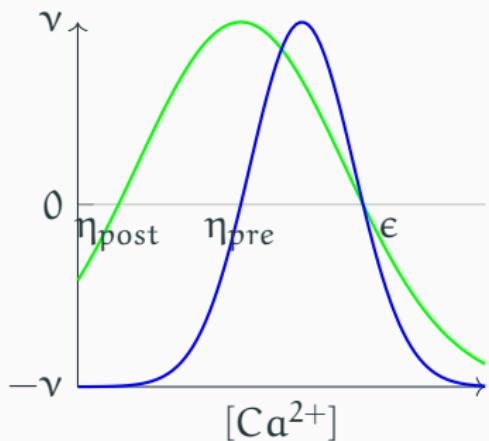

## Late phase

A heatmap illustrating the spatial distribution of different brain regions. The x-axis and y-axis both represent the same two categories: Peri-LPZ and Border Center Border. The color scale indicates the intensity or density of the regions, ranging from yellow (low) to dark blue (high). The highest density of the Border Center Border region is located at the center of the grid, while the Peri-LPZ region surrounds it.

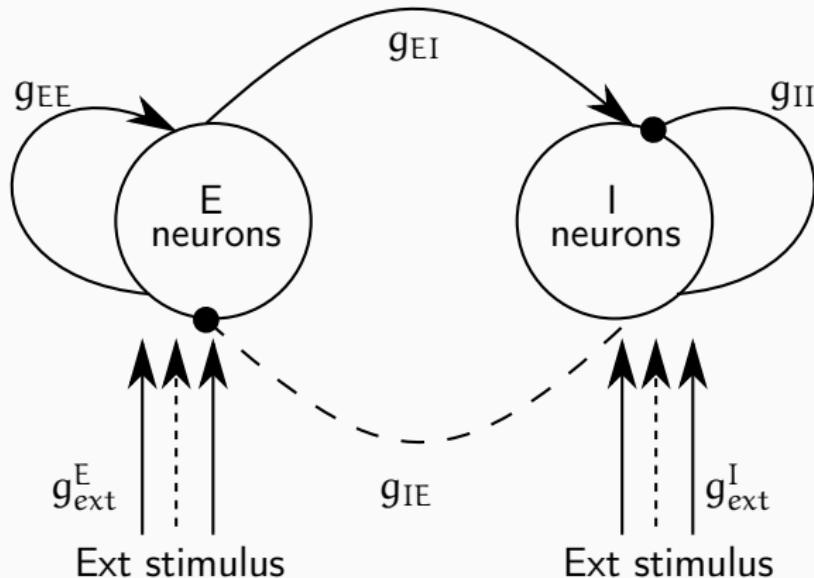

## Computational modelling II: Butz2013 results

## Methods: our approach

---

## Start with a biologically realistic network model

# Extensions

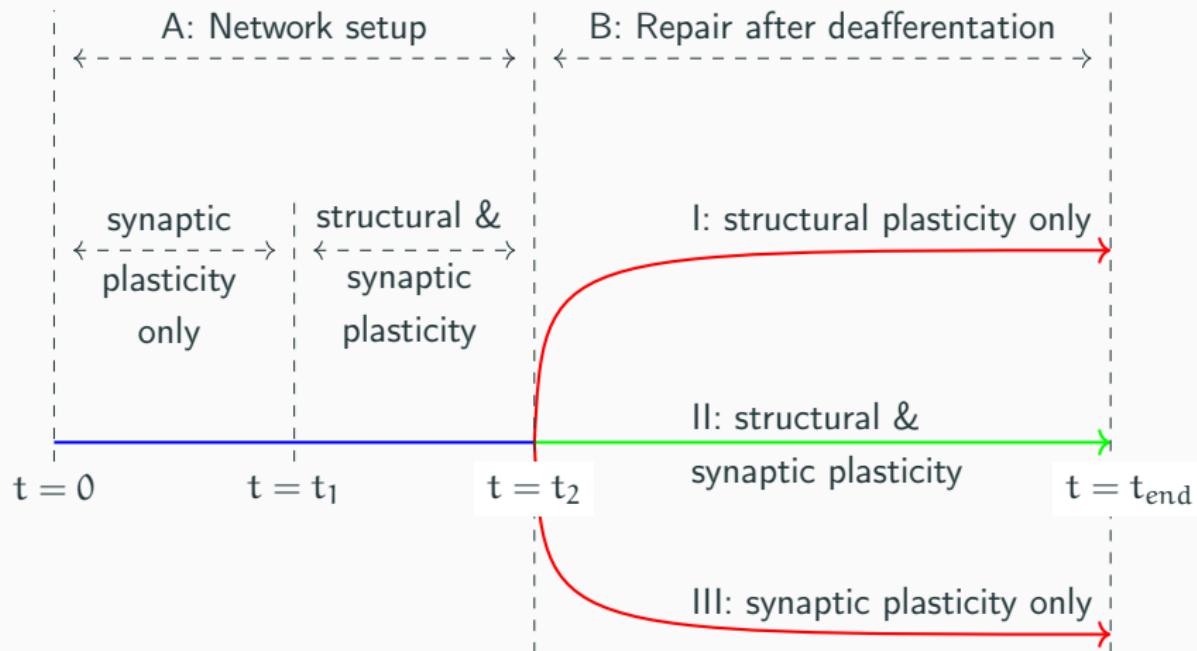

- Probabilistic formation of synapses, also: “longer” inhibitory than excitatory connections<sup>1</sup>.
- Probabilistic deletion of synapses (incorporating evidence that stronger synapses have less likelihood of removal<sup>2</sup>).
- Further generalisation of growth curves.
