What we know from these experiments

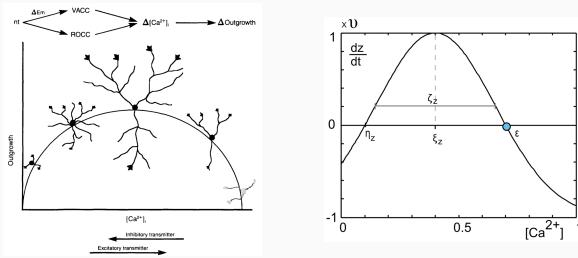

- Massive disinhibition in the LPZ.
- Gradual ingrowth of excitatory synapses from the peri-LPZ to the LPZ.
- Gradual outgrowth of inhibitory synapses from the LPZ to the peri-LPZ.

Notes

Computational modelling: MSP: turnover

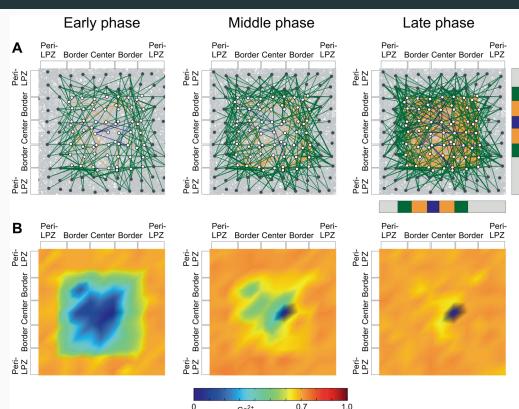

- Synaptic structures (z): excitatory and inhibitory post-synaptic, excitatory or inhibitory pre-synaptic elements.
- New synapses form when free plugs are available: ($z > z_{\text{conn}}$)
- Synapses are deleted if: ($z < z_{\text{conn}}$)

Methods: our approach

Notes

Start with a biologically realistic network model

⁴Vogels, T. P. et al. Inhibitory plasticity balances excitation and inhibition in sensory pathways and memory networks. *Science* 334, 1569–1573. <http://www.sciencemag.org/content/334/6062/1569.short> (2011)

13/18

Notes

Extensions

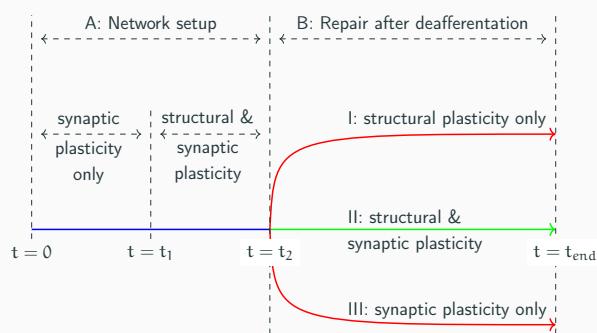

- Probabilistic formation of synapses, also: "longer" inhibitory than excitatory connections¹.
 - Probabilistic deletion of synapses (incorporating evidence that stronger synapses have less likelihood of removal²).
 - Further generalisation of growth curves.
